

EXAMPLE PRODUCT REVIEW

Keep the user's main context visible.

A simple review of **Cairnwell Atlas**, looking at how the product explains which rules apply and why.

Canada

Healthcare

Ontario

Moderate AI usage

QUICK SUMMARY

Atlas already asks for useful details during setup, including location, industry, operating regions and AI use. The main problem is simple: those details become hard to see later. Keeping them visible would make the rest of the product easier to understand.

Example interface copy

"Your requirements are based on your location, industry, AI use and system type."

TWO MAIN PROBLEMS

01

Setup details disappear later

The user can no longer see the setup details that are shaping the guidance.

02

Different rules look equally important

Laws, standards and frameworks look too similar, even when they play different roles.

Simple idea

Keep the user's main context visible, then explain *why* each extra rule or framework is shown.

PROBLEM 01

The main context disappears after setup.

WHAT WE SEE

Before the assessment, Atlas asks for the organisation's location, industry, operating regions and AI use. The Coverage Map also says these details affect which requirements appear.

But once the user moves into areas like the Control Center, Requirements Ledger, Policy Library and Policy Studio, those setup details are no longer easy to see.

WHY THIS IS CONFUSING

The user has to remember which setup details are affecting the page. That gets confusing when rules from other regions or standards also appear.

SIMPLE CHANGE

Keep a short context label visible on later screens. It should show the organisation's main location and industry while still allowing other rules to apply.

Canada	Healthcare	Ontario
--------	------------	---------

Use the same order everywhere: main jurisdiction + industry + operating region. Other rules can appear nearby, but they should clearly look secondary.

WHAT THIS HELPS

Clearer at a glance

Users can quickly see what the product is basing its guidance on, while still understanding that other requirements may also apply.

PROBLEM 02

It is not clear why each rule is shown.

WHAT WE SEE

Policy Studio shows items such as PIPEDA, Ontario PHIPA, the EU AI Act, ISO/IEC 42001 and NIST AI RMF in very similar cards and tags. It makes sense for one organisation to see rules and standards from several places. The problem is that the product does not clearly say why each one is shown.

The names are also inconsistent. Some are short, such as “PIPEDA,” while others are longer, such as “Ontario PHIPA Control Review.”

WHY THIS IS CONFUSING

The user can see many references, but cannot quickly tell the difference between:

- the main law that applies
- a rule that may also apply
- a standard the organisation chose to use
- a framework used as extra guidance

Because they look similar, the user may assume they are equally important even when they are not.

SIMPLE CHANGE

Add a short label to each reference that says what it is and why it is there. This makes the difference between laws, standards and supporting frameworks clear.

Source	What it is	Why it appears
Canada	Federal law	Main location
Ontario	Health privacy law	Main operating region
EU	Regulation	May also apply
Global	Standard	Chosen standard
United States	Framework	Extra guidance

These labels should use the same rules Atlas already uses to decide what applies.

WHAT THIS HELPS

Easier to compare

Atlas can still show a wide range of rules and standards, but users can understand the role of each one much faster.

NEXT STEP

Start with one or two important user flows. Look for the places where context disappears or where different rules are hard to compare. Then update those screens first.

Atlas already has the right information. Showing that information more clearly, and explaining why each rule appears, would make the product easier to understand and easier to trust.
